

# การนำเสนองานวิจัย “Empirical Asset Pricing using xAI”

โดย ผศ. ดร.สัมพันธ์ เนตยานันท์ มหาวิทยาลัยนเรศวร  
ดร.ศิริยศ จุฑานนท์ ตลาดหลักทรัพย์แห่งประเทศไทย  
20 กรกฎาคม 2566

1.1

## Efficient Market Hypothesis (EMH)

- Reflect all available information
- Investors are rational
- Not possible to consistently outperform the market

1.2

## Risk and Expected Return

- Investors typically demand a higher return for taking on greater risks

1.3

## Capital Asset Pricing Model (CAPM)

- The only risk is systematic risk measured by beta
- The rest is the alpha which refers to fund manager performance

1.4

## Factor Model

- Considers risk factors such as size, value, momentum, profitability, etc.

1.5

## Behavioral Finance

- Investors may not always behave rationally with their biases and emotions
- Incorporate behavioral factors such as PEAD, VIX index, and survey may improve model

# Artificial intelligence (AI) can play a significant role in asset pricing models

## Data analysis and feature selection:

- Analyze large volumes of financial data to identify relevant features that impact asset prices
- Able to uncover non-linear relationships

## Risk assessment:

- Evaluating and quantifying various risk factors that impact asset prices

## Pattern recognition and predictive modeling:

- Identify complex patterns and trends in historical asset price data, enabling the development of predictive models

## Portfolio optimization:

- Optimize portfolio construction and asset allocation by considering multiple factors simultaneously

## Sentiment analysis:

- Analyze news articles, social media posts, and other textual data to gauge market sentiment

## High-frequency trading:

- Enable the execution of trades at high speeds based on predefined rules and market signals
- Capitalizing on short-term pricing anomalies and improving overall trading performance

# Some of the key challenges include:

## 01 Data quality and availability

- Heavily rely on high-quality and reliable data for accurate predictions. Historical data may contain errors or missing values.
- Data availability can be a constraint for emerging or illiquid markets.

## 02 High dimensionality and data noise

- Complexity form various indicators such as price, volume and financial ratios. Moreover, some of them are noise in financial market, which can lead to model accuracies.

## 03 Overfitting and model complexity

- Occurs when a model performs well on historical data but fails to generalize to new, unseen data

## 04 Changing market dynamics

- Such as shifts in economic factors, policy changes, or unexpected events
- AI models trained on historical data may struggle to adapt to new unpredictable market conditions or unforeseen events

## 05 Interpretability and transparency

- Often considered "black boxes" because they lack interpretability
- Understanding how the model arrives at its predictions or identifying the key drivers of asset prices can be challenging

# Building trust in AI involves several key considerations: Introducing xAI

01

- Unlike traditional computer programs that follow a set of predefined rules to produce an output
- Machine learning algorithms are designed to learn from data and find patterns on their own
- The decision-making process of a machine learning model is not always transparent

02

- Researchers are working to develop methods to make machine learning algorithms more transparent and interpretable
- Clearly communicate how the AI system arrived at a particular recommendation or decision, enabling users to comprehend and verify the reasoning

03

- Explainable AI (xAI): a set of techniques and methods used in artificial intelligence and machine learning that enable users to understand how a model works and why it arrived at a particular decision or prediction
- Users can gain insights into how an AI system arrived at a particular conclusion, and can potentially identify errors or biases

04

xAI techniques that can be used including:

- Feature Importance Analysis
- Decision Trees:
- Partial Dependence Plots
- Rule-Based Systems:

Main Objective	Research Paper	Predicted Variable	Machine Learning	xAI
<b>Economics forecasting</b>	“An interpretable machine learning work flow with an application to economic forecasting” by Buckmann, Joseph, and Robertson (2021)	<ul style="list-style-type: none"> <li>Forecast US unemployment one year ahead in a monthly dataset</li> </ul>	<ul style="list-style-type: none"> <li>Random Forests</li> <li>Neural Networks</li> <li>Compare to conventional models.</li> </ul>	<ul style="list-style-type: none"> <li>Using SHapley Additive exPlanation (SHAP)</li> </ul>
	“Interpretable deep learning LSTM model for intelligent economic decision-making” by Park and Yang (2022)	<ul style="list-style-type: none"> <li>Predict economic growth rates and crises for major G20 countries</li> </ul>	<ul style="list-style-type: none"> <li>Deep learning model based on the Long Short-term Memory (LSTM) network</li> </ul>	<ul style="list-style-type: none"> <li>Using SHapley Additive exPlanation (SHAP)</li> </ul>
<b>Stock price prediction</b>	“Explainable stock prices prediction from financial news articles using sentiment analysis” by Gite et al. (2021)	<ul style="list-style-type: none"> <li>Predict next-day stock price in the National Stock Exchange (NSE) with Indian finance news headlines</li> </ul>	<ul style="list-style-type: none"> <li>Suggests a technique involving LSTM</li> </ul>	<ul style="list-style-type: none"> <li>Using Local interpretable model-agnostic explanations (LIME)</li> </ul>
	“Explainable AI for Financial Forecasting” Carta, Podda, Recupero, and Stanciu (2022)	<ul style="list-style-type: none"> <li>Predict the next- day returns for stocks in S&amp;P500, CAC, FTSE</li> </ul>	<ul style="list-style-type: none"> <li>Mean Decrease Impurity (MDI)</li> <li>Random forests</li> </ul>	<ul style="list-style-type: none"> <li>Using Local interpretable model-agnostic explanations (LIME)</li> </ul>

Main Objective	Research Paper	Predicted Variable	Machine Learning	xAI
<b>Trading strategy</b>	“The best way to select features? Comparing MDA, LIME and SHAP” Man and Chan (2022)	<ul style="list-style-type: none"> <li>Predict whether each trade of the strategy will be profitable</li> </ul>	<ul style="list-style-type: none"> <li>Random forest</li> </ul>	<ul style="list-style-type: none"> <li>Comparing MDA, LIME and SHAP</li> </ul>
<b>Forecast stock market crisis</b>	“Explainable AI (XAI) models applied to planning in financial markets” by Benhamou Ohana, Saltiel, and Guez (2021)	<ul style="list-style-type: none"> <li>Identification of the most important variables planning stock market crises during March 2020 equity meltdown</li> </ul>	<ul style="list-style-type: none"> <li>Gradient boosting decision tree (GBDT)</li> </ul>	<ul style="list-style-type: none"> <li>Using SHapley Additive exPlanation (SHAP)</li> </ul>
<b>Asset pricing model</b>	“Machine Learning Algorithms for Financial Asset Price Forecasting” by Ndikum (2020)	<ul style="list-style-type: none"> <li>Explores financial asset price forecasting on U.S equities data</li> </ul>	<ul style="list-style-type: none"> <li>High performance computing (HPC) infrastructures vs. the traditional CAPM</li> </ul>	<ul style="list-style-type: none"> <li>None</li> </ul>
	“Empirical Asset Pricing via Machine Learning” by Gu, Kelly, and Xiu (2020)	<ul style="list-style-type: none"> <li>Comparative analysis of machine learning methods for measuring asset risk premia</li> <li>Forecast returns using various predictive features at the firm, industry, and macro levels</li> </ul>	<ul style="list-style-type: none"> <li>Artificial neural networks (ANN)</li> <li>Boosted regression trees</li> <li>Random forests</li> </ul>	<ul style="list-style-type: none"> <li>None</li> </ul>

- **Research Question**
  - **How each factor explains portfolio returns in a machine learning setting by using xAI**
- **Contribution**
  - **One of the first to employ the xAI to an expansive list of financial anomalies to illustrate factor importance**

$$E(LS_{i,t}) = f_{ANN}(F_t)$$

- The left-hand side indicates the zero-cost long-short portfolio
- $F_t$  are constructed from the three-by-five portfolios conditioned on the size
- The model structure is similar to Gu, Kelly, and Xiu (2020)
- Right-hand side variables act like the macroeconomic variables in Gu, Kelly, and Xiu (2020)
- The model is also similar to Gu, Kelly, and Xiu (2021): Includes common factors to explain individual and portfolio returns
- Includes the excess market returns
- There are 188 factors/features in total

- We use the data from 1991 until 2021 to consider all anomalies for factor constructions

- Global-q.org

- 41 momentum
- 32 value-versus-growth
- 29 investment
- 46 profitability
- 30 intangible
- 10 friction anomalies

### Momentum

[Zip folders that contain all 41 momentum anomalies for a given frequency](#)

1-way sorts:      [Daily](#)              [Weekly \(calendar\)](#)              [Weekly \(Wednesday-to-Wednesday\)](#)              [Monthly](#)  
 2-way sorts:      [Daily](#)              [Weekly \(calendar\)](#)              [Weekly \(Wednesday-to-Wednesday\)](#)              [Monthly](#)

[Explanation of CSV filenames for individual momentum anomalies](#)

1. Abr1 ("abr\_1"), cumulative abnormal returns around earnings announcement dates, 1-month holding period;
2. Abr6 ("abr\_6"), cumulative abnormal returns around earnings announcement dates, 6-month holding period;
3. Abr12 ("abr\_12"), cumulative abnormal returns around earnings announcement dates, 12-month holding period;
4. Cim1 ("cim\_1"), customer industries momentum, 1-month holding period;
5. Cim6 ("cim\_6"), customer industries momentum, 6-month holding period;
6. Cim12 ("cim\_12"), customer industries momentum, 12-month holding period;
7. Cm1 ("cm\_1"), customer momentum, 1-month holding period;
8. Cm12 ("cm\_12"), customer momentum, 12-month holding period;
9. dEf1 ("def\_1"), changes in analyst earnings forecasts, 1-month holding period;
10. dEf6 ("def\_6"), changes in analyst earnings forecasts, 6-month holding period;
11. dEf12 ("def\_12"), changes in analyst earnings forecasts, 12-month holding period;
12. Ile1 ("ile\_1"), industry lead-lag effect in earnings surprises, 1-month holding period;
13. Ilr1 ("ilr\_1"), industry lead-lag effect in prior returns, 1-month holding period;
14. Ilr6 ("ilr\_6"), industry lead-lag effect in prior returns, 6-month holding period;
15. Ilr12 ("ilr\_12"), industry lead-lag effect in prior returns, 12-month holding period;
16. Im1 ("im\_1"), industry momentum, 1-month holding period;
17. Im6 ("im\_6"), industry momentum, 6-month holding period;

bmj_12	0.268	4.274	0.063	1.208

## Model

---

- **Using artificial neural networks (ANN), similar to Gu, Kelly, and Xiu (2020)**
- **Geometric pyramid rule from Master (1993)**
- **188 -> 53 -> 15 -> 4 -> 1**
- **Fully connected**
- **Sigmoid activation function**
- **80% as a training sample 20% as a test sample**
- **64 batches and 200 epochs**
- **Loss function: MSE (0.0023)**
- **Google Colab and TensorFlows using Python language**

## SHapley Additive exPlanations (SHAP)

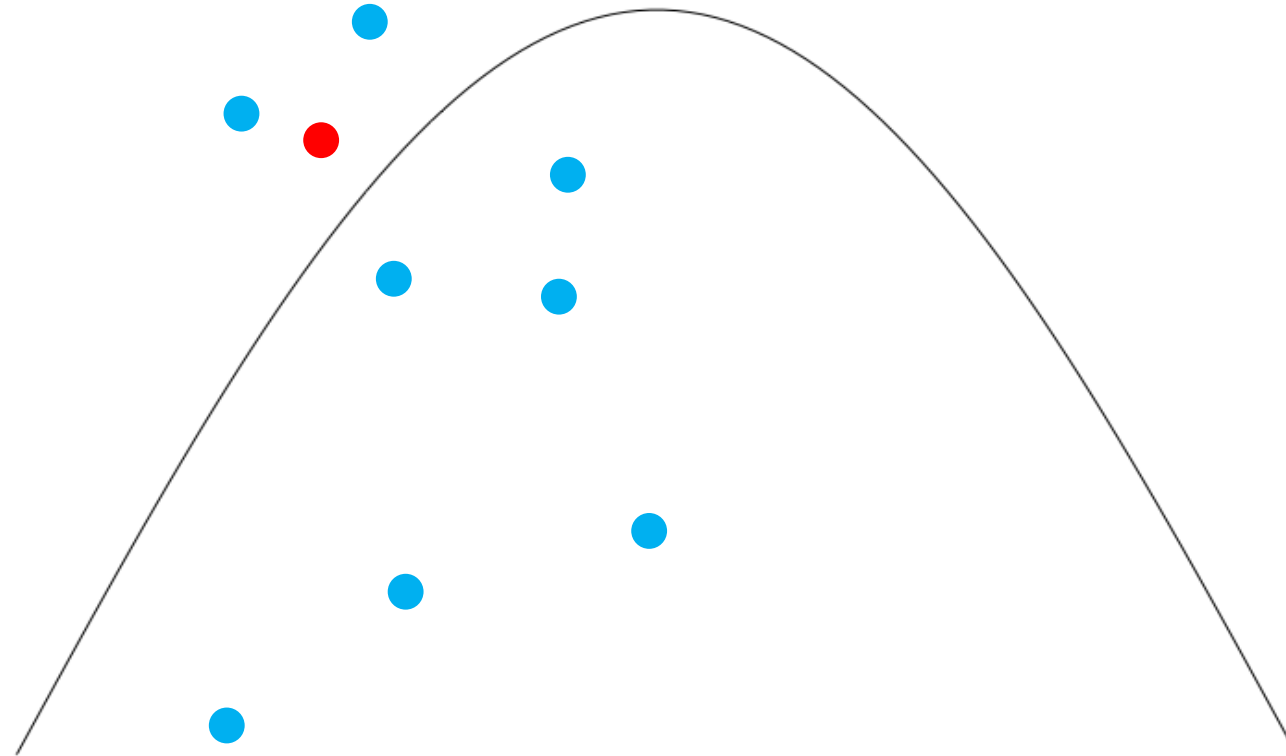

---

- **Explainable AI (xAI) / Interpretable Machine Learning**
- **Lundberg and Lee (2017)**
- **Use to rank feature importance**
- **The idea is based on Shapley value from game theory**
- **Locally importance for each observation, can extend to global importance**
- **It can take up to nine hours for the calculation of SHAP**

# SHapley Additive exPlanations (SHAP)

---

- Similar to Local Interpretable Model-agnostic Explanations (LIME) by Ribeiro, Singh, and Guestrin (2016)

# SHapley Additive exPlanations (SHAP)

---

- Similar to Local Interpretable Model-agnostic Explanations (LIME) by Ribeiro, Singh, and Guestrin (2016)

# SHapley Additive exPlanations (SHAP)

---

- Similar to Local Interpretable Model-agnostic Explanations (LIME) by Ribeiro, Singh, and Guestrin (2016)

## SHapley Additive exPlanations (SHAP)

---

- “Shapley Value” in cooperative game theory

# SHapley Additive exPlanations (SHAP)

- “Shapley Value” in cooperative game theory

- Kernel SHAP
- Tree SHAP
- Deep SHAP

# Running SHAP in real life!!

The screenshot shows a Jupyter Notebook interface with a code editor on the left and a variable explorer on the right. The code editor contains Python code for training a model and running a summary. The variable explorer shows the state of variables: dataset (DataFrame, 11656 rows, 189 columns), df2 (DataFrame, 60910 rows, 191 columns), test\_dataset (DataFrame, 2331 rows, 188 columns), and test\_x (DataFrame, 2331 rows, 188 columns). The console output shows the model's parameter summary.

```
83     optimizer=optimizer,  
84     metrics=['mae', 'mse'])  
85     return model  
86  
87     model = build_model()  
88  
89     model.summary()  
90  
91     history = model.fit(train_x1, train_y1,  
92                        batch_size=64,  
93                        epochs=200,  
94                        verbose=0,  
95                        validation_data=(test_x1, test_y1), callbacks=[tfdocs.modeling.EpochDots()])  
96  
97  
98     #Find MSE  
99     predict_y = model.predict(test_x1)  
100    predict_y = np.reshape(predict_y, len(predict_y))
```

Name	Type	Size	Value
dataset	DataFrame	(11656, 189)	Column names: bm, bmj, bmq_12, cp, cpq_1, cpq_12, cpq_6, dp, dur, ebp, ...
df2	DataFrame	(60910, 191)	Column names: year, month, bm, bmj, bmq_12, cp, cpq_1, cpq_12, cpq_6, ...
test_dataset	DataFrame	(2331, 188)	Column names: bm, bmj, bmq_12, cp, cpq_1, cpq_12, cpq_6, dp, dur, ebp, ...
test_x	DataFrame	(2331, 188)	Column names: bm, bmj, bmq_12, cp, cpq_1, cpq_12, cpq_6, dp, dur, ebp, ...

**Figure 1.** Factor Importance for ANN in the Overall Periods

# Subperiods

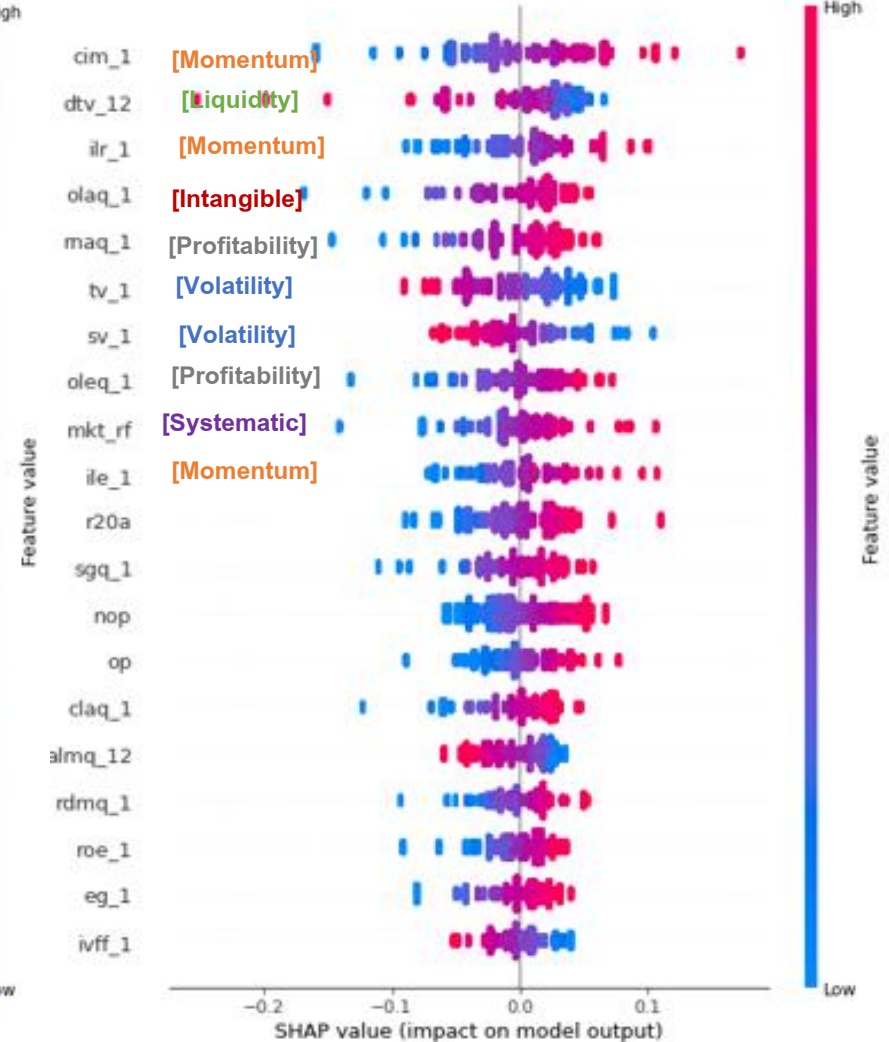

Panel A: 1991-2000

Panel B: 2001-2010

Panel C: 2011-2020

- **Employ the SHAP method to explain returns**
- **Rank feature/factor importance**
- **Find that the top factors explaining returns in overall and subperiod periods differ**
- **Individual or institutional investors can use SHAP to explain the machine learning model**
- **Stock exchanges can explore the SHAP explanation and use it to explain how factors move asset returns in the market**

**SET**

Make it **Work**  
for **Everyone**
